AND BIOLOGICAL EFFECTS**

## co and post translational pdf

Post-translational modification (PTM) refers to the covalent and generally enzymatic modification of proteins following protein biosynthesis. Proteins are synthesized by ribosomes translating mRNA into polypeptide chains, which may then undergo PTM to form the mature protein product. PTMs are important components in cell signaling, as for example when prohormones are converted to hormones.

## Post-translational modification - Wikipedia

Post-translational modifications (PTMs) are at the heart of many cellular signaling events. Apart from a single regulatory PTM, there are also PTMs that function in orchestrated manners.

Termination: When a stop codon is reached, the ribosome folds the polypeptide into its final structure.; In prokaryotes (bacteria), translation occurs in the cytosol, where the medium and small subunits of the ribosome bind to the tRNA. In eukaryotes, translation occurs in the cytosol or across the membrane of the endoplasmic reticulum in a process called co-translational translocation.

Unlike solid tumors, which are often hidden deep within a patient's body, a patient's blood is easy to access safely. As a result, liquid biopsy, the analysis of tumor DNA in the blood, is an attractive alternative to conventional biopsy. Unfortunately, tumor DNA molecules are usually vastly outnumbered by the fragments of noncancer DNA in the blood, and detecting them can be a challenge ...
