Sun, the Earth and other planets in our solar system would float off into space as a result of the absence of the Sun’s gravity. The Sun’s energy influences all of the objects in our solar system differently depending on the distance. The Earth’s distance of 149.60 million km allows the perfect temperature for life to exist on Earth. The Sun is categorized as a yellow dwarf.

IS THERE LIFE OUT THERE? The Search for Habitable Exoplanets5 Here is an image of a galaxy quite like our own, the Milky Way. A galaxy is a collection of stars bound together by gravity. If we could see the Milky Way like we see the galaxy in the picture, our Sun would be at about the position of the white circle. The

It is the largest body in our solar system. Nine planets follow paths called orbits around the sun. The shape of each orbit is

called an ellipse. An ellipse is a flattened circle (see the picture at the bottom of page 3). The nine planets are Mercury, Venus, Earth, Mars, Jupiter, Saturn, Uranus, Neptune, and Pluto.
