Rosalind Franklin. Franklin is best known for her work on the X-ray diffraction images of DNA, particularly Photo 51, while at King's College, London, which led to the discovery of the DNA double helix for which James Watson, Francis Crick and Maurice Wilkins shared the Nobel Prize in Physiology or Medicine in 1962.

Rosalind Franklin, a chemical physicist (1920–1958), used x-ray diffraction to determine the structure of DNA. What exactly could she read out from her x-ray pattern, shown in Fig. 1? 1 In lecture notes dated November 1951, R. Franklin wrote the following: “The results suggest a helical structure (which must be very closely packed) containing 2, 3 or 4 co-axial nucleic acid chains ...
